## CHOOSE ACCOUNT

## SET PRIVACY OF THE APP

**Private**

You and organization members can see.

**Public**

Anyone can see your logs and configs. Use this wisely.

**Next**

## Setup repository access

Specify how Bitrise will be able to access the source code. [No admin rights?](#)

AUTOMATIC

ADD OWN SSH

Do you need to use an additional private repository?

For example for private CocoaPods, fastlane match, submodule, etc.

No, auto-add SSH key

I need to

## Choose branch

It should include the configuration of your project as Bitrise will configure the app based on that.

## Webhook setup

### What is a Webhook?

---

To have Bitrise **automatically start a build every time you push code into your repository** you can set up a webhook at your code hosting service which will automatically trigger a build on Bitrise with the code you push to your repository.

We can automatically register a Webhook for you **if you have administrator rights** for this repository.

**Register a Webhook for me!**

Skip the Webhook registration.
